KASMUI

LAPORAN ANALISIS KOMPARATIF

Perbandingan Hasil Komputasi Kalender Hijriah Global Tunggal (KHGT) dan Neo-MABIMS Berbasis Markas Sabang pada Awal Masehi, Akhir Masehi, dan Jumlah Hari Bulan Hijriah

Cakupan analisis: **1446-1574 H** | 129 tahun Hijriah | Tanggal penyusunan: 28 Oktober 2026

Unit analisis tunggal: 1.548 pasangan bulan (129 tahun x 12 bulan). Seluruh keluaran KHGT dan Neo-MABIMS Sabang dibandingkan sebagai satu deret waktu dan diverifikasi menggunakan data yang tercantum dalam lampiran.

ABSTRAK

Penelitian deskriptif-komparatif ini menganalisis keluaran komputasi Kalender Hijriah Global Tunggal (KHGT) dan model Neo-MABIMS menggunakan markas Sabang, Aceh, pada rentang **1446-1574 H**. Tiga variabel yang dibandingkan adalah tanggal awal Masehi, tanggal akhir Masehi, serta jumlah hari pada setiap bulan Hijriah. Seluruh 1.548 pasangan bulan diperiksa dengan metode pencocokan berdasarkan tahun dan nama bulan, disertai pengujian integritas tanggal serta kontinuitas antarbulan. Tidak ada tahun yang diperlakukan sebagai subperiode analisis tersendiri.

Hasil menunjukkan perbedaan tanggal awal pada **779 bulan (50,32%)**, tanggal akhir pada **780 bulan (50,39%)**, dan jumlah hari pada **1.117 bulan (72,16%)**. Selisih batas tanggal Neo-MABIMS relatif terhadap KHGT berada pada 0 atau +1 hari. Jumlah hari kumulatif KHGT adalah **45.713**, sedangkan model Neo-MABIMS Sabang **45.714**. Perbedaan komputasional dipahami dalam konteks ketidaksamaan lokasi evaluasi, ambang astronomis, dan aturan operasional kalender global-lokal; hasil ini tidak sama dengan validasi rukyat maupun penetapan resmi awal bulan.

Kata kunci: kalender Hijriah; KHGT; Neo-MABIMS; Sabang; komputasi astronomi; tanggal awal bulan; jumlah hari.

1. PENDAHULUAN

Awal bulan kamariah ditetapkan dengan model perhitungan yang memadukan geometri Bulan-Matahari, lokasi pengujian, kerangka geosentris atau toposentris, dan kaidah pembentukan kalender. Dua sistem yang sama-sama memanfaatkan hisab modern dapat menghasilkan tanggal berbeda tanpa otomatis membuktikan kesalahan aritmetika pada salah satunya [1-4].

KHGT diarahkan untuk menghasilkan satu kalender global, sedangkan Neo-MABIMS merupakan kriteria regional yang di Indonesia dioperasionalkan bersama proses hisab, rukyat, dan isbat. Kajian ini mengukur ketidaksamaan keluaran kedua model pada **seluruh periode 1446-1574 H** secara konsisten, bukan hanya membandingkan besar ambang sudutnya.

2. KERANGKA KRITERIA PENENTUAN AWAL BULAN

2.1. Kalender Hijriah Global Tunggal (KHGT)

KHGT yang digunakan Muhammadiyah berlandaskan hisab hakiki kontemporer dengan prinsip matlak global. Dalam implementasi yang ditelaah, tinggi Bulan geosentris minimum 5 derajat dan elongasi geosentris minimum 8 derajat dinilai pada saat maghrib di lokasi pengujian yang relevan. Kedua ambang harus dipahami bersama syarat pembentukan kalender global [1-2].

Dalam pedoman operasional KHGT, PKG 1 terkait pemenuhan kriteria sebelum batas waktu universal, sedangkan PKG 2 menangani pemenuhan setelah batas tersebut disertai persyaratan tambahan, termasuk kondisi geografis Amerika dan ijtimak sebelum fajar di Selandia Baru [1-2]. Karena itu, KHGT tidak terbatas pada pengujian satu markas di Indonesia.

2.2. Neo-MABIMS dengan markas Sabang

Kriteria Neo-MABIMS menetapkan tinggi minimum hilal 3 derajat dan elongasi minimum 6,4 derajat. Model lokal yang digunakan dalam studi ini secara eksplisit mencatat tinggi toposentris, elongasi geosentris, waktu maghrib pada tanggal 29 di Sabang, serta ijtimak UTC. Dalam keluaran model, terpenuhinya kedua ambang menghasilkan bulan 29 hari; apabila tidak terpenuhi diterapkan istikmal 30 hari [3-4].

Keluaran model Sabang adalah simulasi satu markas, **bukan keputusan sidang isbat nasional**. Kriteria kelembagaan Indonesia melibatkan prosedur dan cakupan wilayah yang lebih luas daripada keluaran otomasi satu titik.

2.3. Perbandingan konseptual

Aspek	KHGT	Neo-MABIMS (model studi)
Cakupan	Global; satu matlak dunia	Lokal; markas Sabang
Tinggi hilal	>= 5 derajat, geosentris	>= 3 derajat, toposentris
Elongasi	>= 8 derajat, geosentris	>= 6,4 derajat, geosentris
Momen uji	Maghrib pada lokasi global yang relevan	Maghrib Sabang, tanggal 29
Aturan	PKG 1 / PKG 2; batas waktu UTC	Memenuhi kriteria / istikmal
Sifat	Keluaran kalender global	Keluaran model lokal; bukan isbat

Tabel 1. Perbedaan konseptual dan parameter implementasi dari kedua model komputasional [1-4].

Penelitian visibilitas sabit oleh Odeh serta Doggett dan Schaefer menunjukkan bahwa keterlihatan faktual dipengaruhi geometri relatif, lebar sabit, atmosfer, dan perangkat pengamatan. Oleh karena itu, terpenuhinya ambang geometrik tidak dapat langsung dimaknai sebagai kepastian pengamatan pada setiap kondisi [5-6].

3. BAHAN DAN METODE

3.1. Data, unit analisis, dan cakupan

Unit analisis ialah satu pasangan (tahun Hijriah, nama bulan). Sumber data berasal dari tabel komparatif SOLUNA dan keluaran kalender KHGT maupun Neo-MABIMS Sabang [8]. Pengamatan komputasional terdiri atas 129 tahun Hijriah penuh, dari 1446 sampai 1574 H, dengan 12 bulan pada setiap tahun sehingga **N = 1.548**. Tidak ada pemisahan analisis menurut tanggal penerimaan berkas atau urutan rekonsiliasi data.

Data primer dalam penelitian ini berarti keluaran program yang menjadi objek analisis. Pencocokan dilakukan terhadap baris tahun-bulan yang sama. Dengan cara tersebut, seluruh hasil Neo-MABIMS dianalisis sebagai satu populasi sebagaimana keseluruhan keluaran KHGT.

3.2. Definisi indikator dan rumus operasional

Tanggal awal Masehi merupakan tanggal pertama suatu bulan Hijriah; tanggal akhir adalah tanggal terakhir secara inklusif. Jumlah hari didefinisikan sebagai tanggal akhir dikurangi tanggal awal ditambah satu hari. Selisih awal = tanggal awal Neo-MABIMS dikurangi tanggal awal KHGT; selisih akhir = tanggal akhir Neo-MABIMS dikurangi tanggal akhir KHGT; dan selisih jumlah hari = jumlah hari Neo-MABIMS dikurangi jumlah hari KHGT.

Persentase perbedaan = (jumlah pasangan bulan dengan nilai tidak sama / 1.548) x 100%. **Persentase kesamaan** = (jumlah pasangan bulan dengan nilai sama / 1.548) x 100%. Semua indikator dan tabel statistik menggunakan penyebut yang sama, kecuali tabulasi menurut nama bulan atau blok tahun yang memakai jumlah bulan dalam kelompok tersebut.

3.3. Prosedur pengolahan dan kendali mutu

Prosedur meliputi (1) penyeragaman nama bulan dan tanggal; (2) pengurutan tahun-bulan; (3) pengujian keunikan 1.548 kunci pasangan; (4) pencocokan tanggal awal, akhir, dan panjang bulan; (5) pengujian bulan sepanjang 29-30 hari dan kontinuitas tanggal; serta (6) pengelompokan frekuensi menurut nama bulan, pola pergeseran, dan blok tahun Hijriah.

Pemeriksaan ulang atas tabel komparatif lengkap pada lampiran PDF menghasilkan tepat 1.548 baris, tanpa duplikasi atau kekosongan urutan; rentang tanggal awal dan akhir konsisten dengan nilai panjang bulan, dan rantai antarbulan pada setiap model tidak memiliki jeda maupun tumpang tindih. Frekuensi tabel pokok di bagian hasil dihitung langsung dari semua 1.548 baris.

3.4. Jenis inferensi dan pembatasan metode

Karena keseluruhan keluaran dari rentang yang dipilih dihitung, statistik yang dilaporkan bersifat **deskriptif populasi** dan tidak memerlukan uji signifikansi pada sampel acak. Audit ini tidak mengulang perhitungan posisi astronomis, mengevaluasi ketidakpastian pengamatan hilal, maupun mengesahkan keputusan kalender untuk kepentingan kelembagaan.

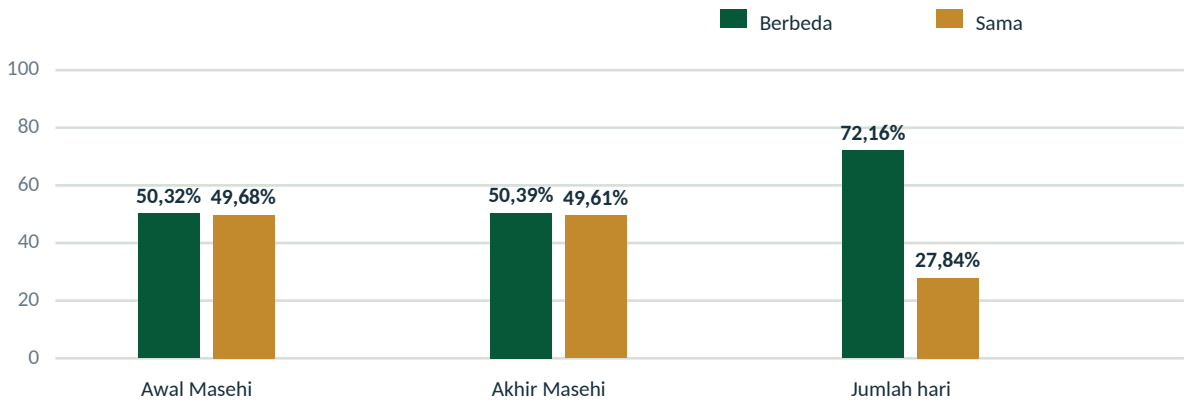

4. HASIL PENELITIAN

4.1. Rekap terpadu 1446-1574 H

Indikator	Berbeda	% berbeda	Sama	% sama	Total
Tanggal awal Masehi	779	50,32%	769	49,68%	1.548
Tanggal akhir Masehi	780	50,39%	768	49,61%	1.548
Jumlah hari	1.117	72,16%	431	27,84%	1.548

Tabel 2. Rekap perbedaan KHGT dan Neo-MABIMS Sabang pada keseluruhan 1.548 bulan, 1446-1574 H.

Dari semua pasangan bulan, tanggal awal berbeda pada 50,32% dan tanggal akhir pada 50,39%. Perbedaan jumlah hari mencapai 72,16%, meskipun pergeseran tanggal batas yang teramati tidak melampaui satu hari. Angka 72,16% menyatakan proporsi *bulan* dengan panjang tidak identik, bukan proporsi hari kalender yang mengalami pergeseran.

Gambar 1. Persentase berbeda dan sama untuk tiga parameter pada populasi 1446-1574 H; seluruh batang memakai penyebut 1.548 bulan.

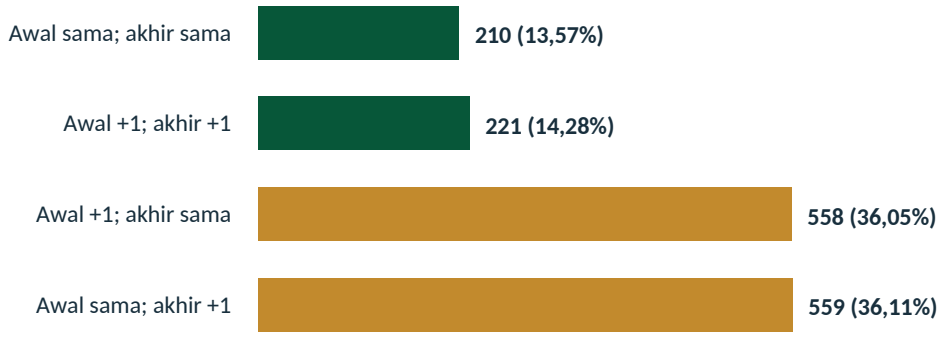

4.2. Empat pola hubungan tanggal awal dan akhir

Pola (Neo-MABIMS dikurangi KHGT)	Jumlah bulan	Persentase
Awal sama; akhir sama; panjang sama	210	13,57%
Awal +1; akhir +1; panjang sama	221	14,28%
Awal +1; akhir sama; Neo lebih pendek	558	36,05%
Awal sama; akhir +1; Neo lebih panjang	559	36,11%
JUMLAH	1.548	100,00%

Tabel 3. Partisi eksklusif empat pola selisih kalender untuk seluruh 1446-1574 H.

4.2. Pola pergeseran tanggal (lanjutan)

Keempat pola dalam Tabel 3 membentuk partisi lengkap: 431 bulan sama panjang, sedangkan 1.117 bulan berbeda panjang. Selisih awal dan akhir masing-masing hanya bernilai 0 atau +1 hari. Dari kelompok yang panjangnya berbeda, Neo-MABIMS lebih pendek satu hari pada 558 bulan dan lebih panjang satu hari pada 559 bulan. Ketidakseimbangan +1 bulan-hari tersebut menghasilkan jumlah kumulatif Neo-MABIMS satu hari lebih besar.

Gambar 2. Distribusi empat pola selisih tanggal pada 1.548 bulan Hijriah (1446-1574 H).

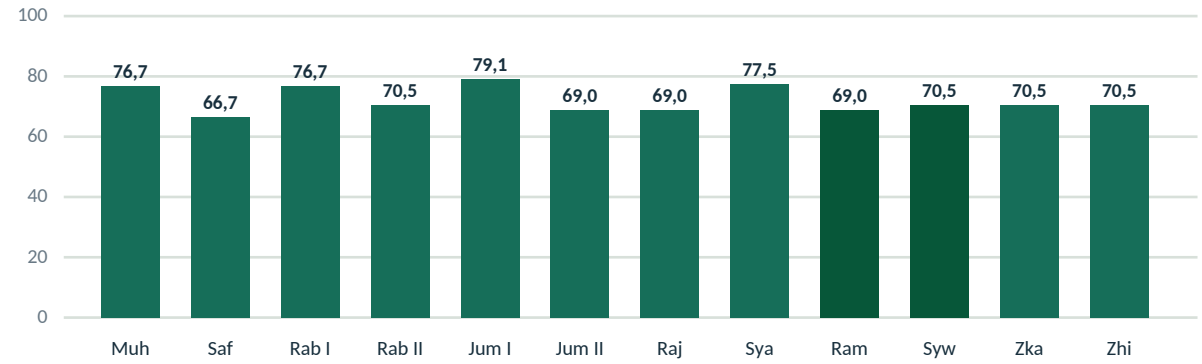

4.3. Variasi menurut nama bulan Hijriah

Bulan	Awal berbeda	Akhir berbeda	Hari berbeda	% hari berbeda
Muharam	62	69	99	76,74%
Safar	69	63	86	66,67%
Rabiulawal	63	62	99	76,74%
Rabiulakhir	62	61	91	70,54%
Jumadilawal	61	67	102	79,07%
Jumadilakhir	67	66	89	68,99%
Rajab	66	61	89	68,99%
Syakban	61	69	100	77,52%
Ramadan	69	70	89	68,99%
Syawal	70	67	91	70,54%
Zulkaidah	67	62	91	70,54%
Zulhijah	62	63	91	70,54%

Tabel 4. Seluruh nama bulan muncul 129 kali selama 1446-1574 H; persentase tiap baris berbasis 129 bulan.

Frekuensi perbedaan panjang bulan tertinggi terjadi pada Jumadilawal (102 dari 129; 79,07%), disusul Syakban (100 dari 129; 77,52%), sedangkan Safar paling rendah (86 dari 129; 66,67%). Pada Ramadan, panjang bulan berbeda 89 kali (68,99%) dan tanggal awal berbeda 69 kali (53,49%). Ini adalah deskripsi keluaran perangkat lunak, bukan hasil uji probabilitas visibilitas fisik.

4.3. Distribusi antarbulan (lanjutan)

Gambar 3. Persentase perbedaan jumlah hari menurut 12 nama bulan dalam populasi lengkap 1446-1574 H.

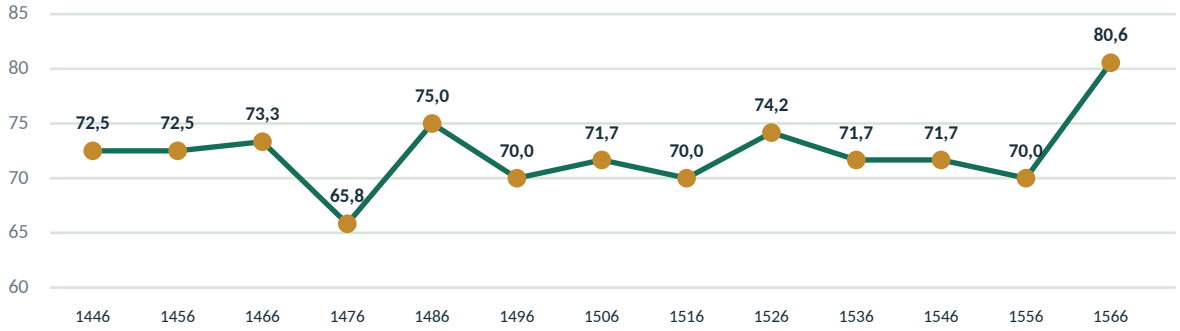

4.4. Frekuensi menurut blok tahun Hijriah

Agar pembagian waktu tidak memisahkan tahun pertama dari keseluruhan data, blok sepuluh tahun dimulai pada **1446-1455 H**, dilanjutkan secara berurutan sampai **1566-1574 H** sebagai blok sembilan tahun terakhir. Setiap blok penuh berisi 120 bulan dan blok terakhir 108 bulan.

Rentang H	Bulan	Awal beda	Akhir beda	Hari beda	% hari beda
1446-1455	120	63	64	87	72,50%
1456-1465	120	56	55	87	72,50%
1466-1475	120	64	64	88	73,33%
1476-1485	120	55	56	79	65,83%
1486-1495	120	64	64	90	75,00%
1496-1505	120	58	58	84	70,00%
1506-1515	120	63	63	86	71,67%
1516-1525	120	59	59	84	70,00%
1526-1535	120	61	60	89	74,17%
1536-1545	120	61	61	86	71,67%
1546-1555	120	62	62	86	71,67%
1556-1565	120	60	60	84	70,00%
1566-1574	108	53	54	87	80,56%

Tabel 5. Kelompok tahun berurutan yang mencakup seluruh periode 1446-1574 H tanpa memisahkan salah satu tahun.

4.4. Pola antardekade (lanjutan)

Gambar 4. Variasi proporsi bulan yang berbeda panjangnya menurut blok tahun Hijriah sejak 1446 H; blok akhir mencakup 9 tahun.

Nilai perbedaan panjang bulan berkisar dari 65,83% pada blok 1476-1485 H hingga 80,56% pada blok 1566-1574 H. Fluktuasi antarblok bersifat deskriptif dan tidak dapat dengan sendirinya dipakai sebagai bukti tren waktu astronomis maupun pergeseran sistematis kriteria.

4.5. Keputusan PKG dan arah pergeseran

Kategori keluaran KHGT	Jumlah bulan	Proporsi populasi
PKG 1	1.387	89,60%
PKG 2	161	10,40%
JUMLAH	1.548	100,00%

Tabel 6. Frekuensi keputusan PKG dalam keseluruhan data 1446-1574 H.

Dari 161 bulan yang diberi label PKG 2, seluruhnya memiliki tanggal awal Neo-MABIMS Sabang satu hari setelah KHGT. Hal ini merupakan asosiasi empiris pada keluaran model yang diperiksa, bukan pembuktian bahwa PKG 2 adalah satu-satunya sebab; kondisi hilal lokal dan hubungan dengan batas waktu UTC juga memerlukan pemeriksaan kasus demi kasus.

4.6. Jumlah hari kumulatif dan komposisi 29/30 hari

Parameter	KHGT	Neo-MABIMS Sabang
Bulan 29 hari	727	726
Bulan 30 hari	821	822
Jumlah seluruh hari	45.713	45.714

Tabel 7. Komposisi panjang bulan selama 129 tahun Hijriah; selisih jumlah total adalah satu hari.

Kesamaan hampir seluruh total hari tidak menandakan identitas penempatan hari pada nama bulan. Pada tanggal awal rentang, kedua model sama-sama memulai Muharam 1446 H pada 7 Juli 2024; pada ujung akhir, penutupan Zulhijah 1574 H terjadi 2 September 2149 (KHGT) dan 3 September 2149 (Neo-MABIMS).

5. PEMBAHASAN

5.1. Mengapa tanggal awal berbeda?

Sumber konseptual ketidaksamaan adalah persoalan astronomis dan kalender yang berbeda. KHGT mencari pemenuhan syarat pada cakupan global dengan ketentuan batas waktu universal serta aturan PKG. Model Neo-MABIMS Sabang menguji parameter pada maghrib lokal tanggal 29 di satu lokasi. Hasil pemenuhan syarat di sebagian wilayah dunia dapat mendahului hasil uji di Sabang, sehingga tanggal KHGT dalam tabel dapat lebih awal satu hari.

Pemeriksaan seluruh 1.548 pasangan memperlihatkan 769 tanggal awal sama dan 779 tanggal awal Neo-MABIMS lebih lambat satu hari. Tidak ditemukan tanggal awal Neo-MABIMS lebih dini daripada KHGT dalam dataset ini. Temuan tersebut tidak otomatis menjadi hukum umum untuk setiap sistem kalender atau setiap pilihan titik lokasi.

Walaupun batas angka KHGT 5 derajat dan 8 derajat lebih besar secara nominal daripada 3 derajat dan 6,4 derajat, membandingkan angka saja tidak sah untuk memperkirakan urutan tanggal tanpa menyamakan geometri pengukuran, lokasi, waktu evaluasi, dan aturan pengambilan keputusan. Kedua model menggunakan cakupan wilayah dan kerangka tinggi yang berbeda.

5.2. Mengapa perbedaan jumlah hari mencapai 72,16%?

Panjang bulan ditentukan oleh jarak dari tanggal awal ke tanggal akhir inklusif. Apabila awal sama dan akhir Neo-MABIMS lebih lambat satu hari, bulan model Neo-MABIMS menjadi lebih panjang. Sebaliknya, ketika awal Neo-MABIMS satu hari lebih lambat tetapi akhir sama, bulan Neo-MABIMS menjadi lebih pendek. Kedua batas juga dapat bergeser serempak sehingga panjang bulan tetap sama.

> **Identitas aritmetis:** selisih jumlah hari = selisih tanggal akhir - selisih tanggal awal. Dengan demikian, selisih tanggal batas sebesar satu hari saja dapat menghasilkan 558 bulan Neo-MABIMS lebih pendek dan 559 bulan lebih panjang, tanpa kontradiksi terhadap total kumulatif yang hanya berselisih satu hari.

5.3. Peran PKG 2 dalam interpretasi data

Dalam seluruh periode, 161 bulan berlabel PKG 2 dan semuanya memperlihatkan perbedaan tanggal awal +1 hari untuk Neo-MABIMS terhadap KHGT. Namun keterkaitan ini tidak cukup untuk menyimpulkan kausalitas tunggal. Pengujian lanjutan memerlukan log titik geografis pemenuhan kriteria, waktu maghrib setempat, waktu ijtimak, serta status kriteria di Sabang untuk bulan yang sama.

5.4. Ilustrasi perbedaan pada bulan-bulan ibadah

Contoh berikut dipilih dari beberapa bagian deret 1446-1574 H. Setiap contoh diperlakukan sebagai bagian populasi yang sama, tanpa mengangkat suatu tahun menjadi kelompok studi tersendiri. Tanggal awal ditampilkan dalam kalender Masehi; K = KHGT, N = Neo-MABIMS Sabang.

Bulan H	Awal KHGT	Awal Sabang	Hari K / N	Selisih awal
Ramadan 1446	01-03-2025	01-03-2025	29 / 30	+0
Syawal 1446	30-03-2025	31-03-2025	30 / 29	+1
Zulhijah 1446	28-05-2025	28-05-2025	29 / 30	+0
Ramadan 1447	18-02-2026	19-02-2026	30 / 30	+1
Syawal 1447	20-03-2026	21-03-2026	29 / 29	+1
Zulhijah 1447	18-05-2026	18-05-2026	29 / 29	+0
Ramadan 1448	08-02-2027	08-02-2027	29 / 30	+0
Syawal 1448	09-03-2027	10-03-2027	30 / 29	+1
Ramadan 1500	21-07-2077	21-07-2077	29 / 30	+0
Syawal 1550	23-02-2126	24-02-2126	30 / 30	+1
Ramadan 1574	09-05-2149	09-05-2149	29 / 29	+0
Zulhijah 1574	05-08-2149	05-08-2149	29 / 30	+0

Tabel 8. Sampel ilustratif lintas tahun dari dataset yang sama; semua nilai telah diperoleh dari baris komparatif 1446-1574 H.

Ramadan 1446 H dimulai pada 1 Maret 2025 di kedua model, tetapi panjang bulan masing-masing 29 dan 30 hari; Syawal 1446 H mulai 30 Maret menurut KHGT dan 31 Maret menurut model Sabang. Ramadan 1447 H berbeda satu hari pada tanggal mulai, tetapi keduanya berdurasi 30 hari. Pada Syawal 1447 H perbedaan tanggal mulai juga satu hari, sementara jumlah hari sama-sama 29. Variasi pada dua tahun tersebut merupakan contoh dari pola umum yang berulang di seluruh rentang studi.

Contoh pada tahun-tahun yang berjauhan mengilustrasikan bahwa hubungan tanggal awal dan panjang bulan tidak konstan. Angka di tabel merepresentasikan **prediksi perangkat lunak**; tanggal keagamaan resmi tetap mengikuti mekanisme kelembagaan yang berlaku, bukan ditetapkan oleh tabel ini.

5.5. Arti statistik serta relevansi bagi pengguna kalender

Persentase perbedaan panjang bulan 72,16% menunjukkan frekuensi tinggi perubahan penempatan panjang 29/30 hari di antara kedua keluaran. Namun nilai itu tidak menyatakan bahwa 72,16% hari dalam suatu rentang kalender salah, tidak akurat, atau berbeda pada penomoran tanggal. Penafsiran yang tepat memerlukan pembedaan antara identitas tanggal awal, identitas tanggal akhir, dan identitas panjang bulan.

Pada 129 tahun Hijriah yang dianalisis, jumlah kumulatif yang hampir sama adalah akibat saling mengimbangi antara bulan yang lebih pendek dan lebih panjang. Pembuat perangkat lunak kalender dan perencana kegiatan perlu mengantisipasi perbedaan pada bulan-bulan tertentu, bukan memaksakan penyetaraan tanggal berdasarkan selisih total satu hari.

5.6. Mengapa hasil ini bukan uji akurasi astronomis?

Akurasi astronomis harus diuji terhadap acuan independen yang diketahui presisi dan modelnya, termasuk efemeris, kerangka geosentris/toposentris, algoritme refraksi, ketinggian horizon, konversi waktu, serta toleransi numerik. Laporan ini mengevaluasi kalender jadi; data yang tersedia belum cukup untuk mengaudit ulang seluruh proses astronomi mulai dari posisi benda langit [5-7].

Validitas peluang rukyat fisik juga merupakan pertanyaan yang berbeda. Rekam pengamatan hilal mencakup keadaan atmosfer, kondisi optik, lebar sabit, dan kualitas catatan. Karena itu, temuan berbeda atau sama antara KHGT dan Neo-MABIMS tidak dapat langsung dinilai sebagai kebenaran pengamatan, validitas hukum, atau keputusan isbat.

5.7. Makna perbandingan global dan satu markas

Kesimpulan komparatif bergantung pada definisi model. KHGT merupakan keluaran sistem kalender global, sedangkan Neo-MABIMS dalam studi ini memakai satu titik Sabang. Perbedaan itu menjadi bagian dari desain pembanding, dan harus dinyatakan secara eksplisit ketika laporan dikutip. Penetapan awal bulan resmi Indonesia dapat memerlukan informasi rukyat dan cakupan wilayah yang tidak dimodelkan dalam keluaran satu markas.

Catatan interpretasi: kata *berbeda* pada semua tabel berarti dua keluaran program tidak identik pada parameter terkait. Kata tersebut **tidak sama** dengan penilaian *salah*, *gagal dirukyat*, atau *tidak sah*.

6. KETERBATASAN DAN KEANDALAN ANALISIS

6.1. Audit data tidak identik dengan audit efemeris

Laporan ini menguji kecocokan tabel sumber dan konsistensi internal 1.548 pasangan bulan, bukan menghitung ulang ephemeris Matahari-Bulan. Tanpa log numerik lengkap per titik uji global, akurasi algoritme posisi dan besarnya koreksi astronomi tidak dapat dinilai secara independen.

6.2. Prediksi jangka panjang dan ketentuan kelembagaan

Rentang 1446-1574 H meluas hingga awal September 2149 M, sehingga sebagian besar tanggal dalam dataset masih merupakan prediksi. Hasil hisab masa depan bukan rekaman rukyat historis. Ephemeris, implementasi perhitungan, dan kebijakan kalender yang dipakai institusi dapat diperbarui pada masa mendatang.

6.3. Perbedaan basis pengamatan

Seri KHGT memanfaatkan pencarian global dengan parameter geometrik yang didokumentasikan secara geosentris; seri Sabang menampilkan tinggi Bulan toposentris dan elongasi geosentris pada maghrib setempat. Karena basis geografis dan kerangka pengukuran berbeda, statistik dalam laporan tidak dapat mengisolasi dampak numerik ambang 5/8 derajat terhadap 3/6,4 derajat secara independen.

6.4. Kelengkapan dan integritas populasi

Seluruh 1.548 baris dalam rekap 1446-1574 H memiliki pasangan nama bulan dan tahun unik; tanggal awal-akhir sesuai panjang bulan 29 atau 30 hari, dan urutan antarbulan kontinyu pada masing-masing kalender. Pemeriksaan lintas berkas mencakup kedua seri selama rentang yang sama. Penilaian mutu tersebut mendukung **keandalan analisis deskriptif**, namun tidak menggantikan audit astronomis maupun verifikasi observasional.

6.5. Ruang lingkup kesimpulan

Laporan ini tidak menguji keberhasilan rukyat faktual, hasil almanak pemerintah, penerimaan fikih, maupun validitas putusan sidang isbat. Pernyataan kausal atas perbedaan bulanan memerlukan data tambahan yang menghubungkan momen ijtimak, maghrib tiap lokasi global, pemenuhan PKG, dan parameter geometri hilal pada waktu relevan.

7. KESIMPULAN DAN REKOMENDASI

7.1. Kesimpulan

1. Kajian atas keseluruhan **1.548 bulan** dalam periode **1446-1574 H** menemukan 779 perbedaan tanggal awal (50,32%), 780 perbedaan tanggal akhir (50,39%), dan 1.117 perbedaan panjang bulan (72,16%) antara KHGT dan Neo-MABIMS Sabang.

2. Pergeseran tanggal awal dan akhir Neo-MABIMS relatif terhadap KHGT pada data yang dikaji bernilai 0 atau +1 hari. Dari empat pola tanggal yang mungkin teramati, 210 bulan sama seluruhnya, 221 bulan bergeser serempak satu hari, 558 bulan memiliki Neo-MABIMS lebih pendek, dan 559 bulan lebih panjang.

3. Komposisi 29 dan 30 hari berbeda penempatannya. KHGT menghasilkan 45.713 hari, sedangkan Neo-MABIMS 45.714 hari dalam rentang yang sama. Selisih total satu hari tidak meniadakan perbedaan panjang pada lebih dari seribu nama bulan.

4. Semua analisis menurut nama bulan dan blok tahun menggunakan populasi yang sama sejak 1446 H. Perbedaan panjang bulan tertinggi menurut nama bulan terjadi pada Jumadilawal (79,07%), sedangkan blok 1566-1574 H mencatat 80,56%. Statistik ini tidak membuktikan tren maupun kualitas visibilitas secara kausal.

5. Perbedaan hasil lebih tepat dipahami sebagai konsekuensi implementasi kalender global dan model satu markas dengan aturan operasional tidak sama. Laporan bersifat audit komputasional dan bukan penilaian independen atas keakuratan ephemeris atau keputusan nasional.

7.2. Rekomendasi penelitian lanjutan

Disarankan agar (a) hasil mentah, versi SOLUNA, dan data parameter tiap bulan dipublikasikan secara sistematis; (b) konfigurasi ephemeris, koordinat, serta konversi waktu diaudit independen; (c) Neo-MABIMS diuji pada sejumlah markas lain dan skenario wilayah Indonesia; (d) keluaran komputasional dibandingkan dengan laporan rukyat terverifikasi dan ketetapan isbat; serta (e) sensitivitas PKG 2 terhadap batas waktu universal diperiksa secara numerik.

> Seluruh simpulan di atas berlaku untuk model, dataset, dan cakupan lokasi yang dinyatakan. Tidak ada pemisahan tahun awal dari 129 tahun Hijriah yang dianalisis.

LAMPIRAN A. CUPLIKAN DATA BULANAN DALAM DERET 1446-1574 H

Tabel berikut menyajikan 24 baris awal dari tabel komparatif lengkap yang dimulai pada Muharam 1446 H. Baris 1446 dan 1447 H ditampilkan berturut-turut sebagai **cuplikan penelusuran data**, bukan analisis terpisah menurut tahun. Keseluruhan 1.548 baris dapat diperiksa pada lampiran tabulasi penuh halaman 53-81.

H	Bulan	Awal K	Akhir K	Hari K	Awal N	Akhir N	Hari N

Tabel A1. Dua puluh empat baris pertama dari populasi penuh; K = KHGT, N = Neo-MABIMS Sabang; tanggal akhir inklusif.

Secara operasional, selisih panjang setiap baris dapat dihitung langsung dari Hari N dikurangi Hari K. Tabel melanjutkan urutan Muharam 1446 H hingga Zulhijah 1447 H tanpa mengubah data tanggal dan jumlah hari yang dilaporkan dalam sumber.

LAMPIRAN B. CONTOH PARAMETER ASTRONOMI NEO-MABIMS

Sebagai jejak audit numerik, Tabel B1 memuat dua belas baris pertama dari seri **1.548 bulan Neo-MABIMS Sabang (1446-1574 H)** dan empat baris berikutnya. Cuplikan awal deret digunakan untuk memeriksa format parameter dan keputusan *memenuhi* atau *istikmal*; bukan populasi terpisah, dan tidak dijadikan penyebut statistik hasil penelitian.

Tabel B1. Cuplikan parameter tinggi dan elongasi dari keluaran Neo-MABIMS; waktu maghrib ditulis sebagaimana tampak pada berkas sumber, sementara ijtimak mengikuti UTC. Zona waktu rekaman maghrib perlu diaudit lintas berkas sebelum dikonversi. Angka sudut dibulatkan untuk tampilan.

Keluaran sumber memuat lima keputusan memenuhi kriteria dan tujuh istikmal pada dua belas baris pertama. Angka tinggi dan elongasi tersimpan digunakan untuk memeriksa konsistensi logika keputusan tanpa mengubah kedudukan semua baris tersebut sebagai bagian populasi penuh. Sebagai salah satu contoh sensitivitas, elongasi pada baris Syakban 1446 H bernilai asli 6,400802 derajat, sangat dekat batas 6,4 derajat.

Untuk evaluasi numerik lintas periode, besaran berpresisi penuh, parameter koreksi astronomis, dan waktu maghrib yang sepadan harus ditelusuri dari berkas sumber. Lampiran ini hanya cuplikan audit dan tidak menjadi landasan simpulan tahun tertentu.

REKAPITULASI PERBEDAAN: KHGT vs NEO MABIMS SABANG

Periode 1446–1574 H | 1.548 bulan Hijriah

Aspek Perbandingan	Jumlah Berbeda	% Berbeda	Jumlah Sama	% Sama	Total Bulan
Awal Masehi	**779**	**50,32%**	769	49,68%	1.548
Akhir Masehi	**780**	**50,39%**	768	49,61%	1.548
Jumlah Hari	**1.117**	**72,16%**	431	27,84%	1.548

Keterangan: Berbeda = jumlah bulan yang nilainya tidak sama pada kedua metode; Sama = jumlah bulan yang nilainya identik.

Persentase = jumlah bulan berbeda/sama dibagi total bulan × 100%. Perhitungan mencakup semua 12 bulan pada setiap tahun 1446–1574 H.
